

Saksham Sarda

I build and debug product-facing systems across TypeScript, React, browser automation, AI workflows, and conversion-focused web experiences.

PROFILE

Product-minded engineer with public proof across developer tooling, browser agents, interactive frontend systems, and evidence-based debugging. I prefer concrete artifacts over résumé claims: working demos, focused tests, readable tradeoffs, and deployable handoffs.

SELECTED ENGINEERING WORK

Whiz · terminal copilot

280 GitHub stars

github.com/cloudycotton/whiz

Open-source TypeScript CLI that turns natural-language requests into terminal actions, with explicit privacy boundaries and cross-platform command handling.

Pulse UI keyboard-selection fix

Open pull request

github.com/timestored/pulseui/pull/396

Implemented keyboard selection synchronization, guarded mouse-only side effects, strengthened light/dark focus states, and added focused regression tests. The pull request currently has a clean merge status.

Browser Operator · agent framework

TypeScript

github.com/cloudycotton/browser-operator

Browser-control framework and CLI for executing natural-language web tasks and generating reusable deterministic action scripts.

Interactive product proof portfolio

Live demos

cloudycotton.github.io/local-service-sites

Built deployable proofs spanning a workflow graph editor, React storefront, browser-based eyewear try-on, data-grid interaction test, proposal system, and mobile-first service websites.

CORE SKILLS

TypeScript & JavaScript

React & frontend systems

Python & automation

Browser agents & evaluation

API and workflow integration

Product debugging & QA

HTML, CSS & responsive UI

Technical writing & scoping

HOW I WORK

Evidence first

Separate observable behavior from assumptions before proposing a fix.

Narrow validation

Add focused tests and checks around the behavior actually changed.

Product judgment

Balance implementation quality with usability, delivery risk, and business constraints.

Clear handoff

Ship working artifacts, reproducible verification, and explicit tradeoffs.

Available for **remote contract work**, paid technical trials, product engineering, AI workflow evaluation, and focused debugging engagements.
